

Project Background

Extreme weather events increasingly threaten Solano County's transportation system, with wildfires and flooding disrupting key routes and infrastructure. In response, local jurisdictions have initiated climate adaptation and resiliency plans.

Building on this work, the Solano Transportation Authority (STA) is developing the Solano Transportation Resiliency Plan (STRP) to make the county's transportation network more reliable and resilient to the extreme weather events of both today and the future. The STRP, in partnership with all seven Solano County cities and the County of Solano, will assess the existing transportation system—from Routes of Regional Significance, Transit Facilities of Regional Significance (such as the Vallejo Ferry Terminal, the Solano Rail Hub and Fairfield-Vacaville Hannigan Station), and active transportation facilities—to identify infrastructure vulnerable to extreme weather events and recommend improvements.

Take the STA STRP survey to help the STA understand your experiences with weather impacts on transportation and identify resilience priorities:

Project Goals

- Protect Solano County's transportation infrastructure by developing proactive responses to extreme weather event risks
- Make the system more adaptable and resilient to future hazards
- Identify and prioritize capital projects that preserve vital transportation routes
- Identify funding opportunities to support recommended projects

Get Involved

During this process, the STA will ask for your feedback, experiences of extreme weather event impacts to the local transportation infrastructure, and your priorities for the Solano Transportation Resiliency Plan.

Join Our In-Person or Virtual Community Meetings

August 19, 6-7:30 p.m. at the STA Office
August 21, 6-7:30 p.m. via Zoom
